Part B: Domain Description

Describe your domain chosen for DV II

This project is in environmental monitoring and coastal water-quality management. It examines pollution pressure in Great Barrier Reef inshore waters, especially sediment, nutrients and pesticide-related runoff that reaches reef-connected coastal water.

Describe the Why and Who aspects of your DV II

I chose the topic because Reef pollution is often discussed in broad terms, but general readers rarely see how it varies by place, pollutant and time. The target audience is a public audience rather than technical specialists, so the page is written as an explanatory story instead of a technical dashboard. Readers should be able to identify where hotspots occur, which pollutants matter, when runoff signals strengthen, what ecological responses appear and whether management targets are being met.

Describe the “What” aspect of your DV II

The visualisation uses only official data. The main sources are the AIMS inshore water-quality monitoring database, AIMS Marine Monitoring Program hard coral cover records, and Reef Plan report card and target reporting for 2021-2022. I selected these sources because they connect short-term water-quality observations, longer-term ecological response and formal management assessment. I cleaned and reorganised the data into analysis-ready tables for Vega-Lite by filtering to relevant inshore

records, calculating site or regional medians, grouping map values into percentile classes and converting reported current-versus-target reductions into target-completion percentages.

Describe the “How” aspect of your DV II

I used different idioms for different tasks. A map answers the first question of where suspended-solids hotspots appear. Small-multiple bar charts compare regional rankings across DIN, suspended solids and chlorophyll a, showing that hotspots change by indicator. A heatmap summarises Reef Plan pollutant grades by region and category. Line charts show monthly and longer-term temporal patterns, while scatterplots show relationships between water-quality measures and ecological response variables. Progress bars communicate management completion rates quickly for non-specialist readers. The page is structured as a chapter-based story so readers move from monitoring scope to pollutant pattern, time signal, ecological consequence and management progress. Each chart is a separate Vega-Lite JSON specification loaded through a custom JavaScript embedding script, which made the project modular and easy to revise.

AI use declaration

Generative AI tools were used to support code iteration, layout revision, and wording refinement. All topic selection, source checking, data-use decisions, chart interpretation, and final submitted content were decided by the student.

Part C: Sketch

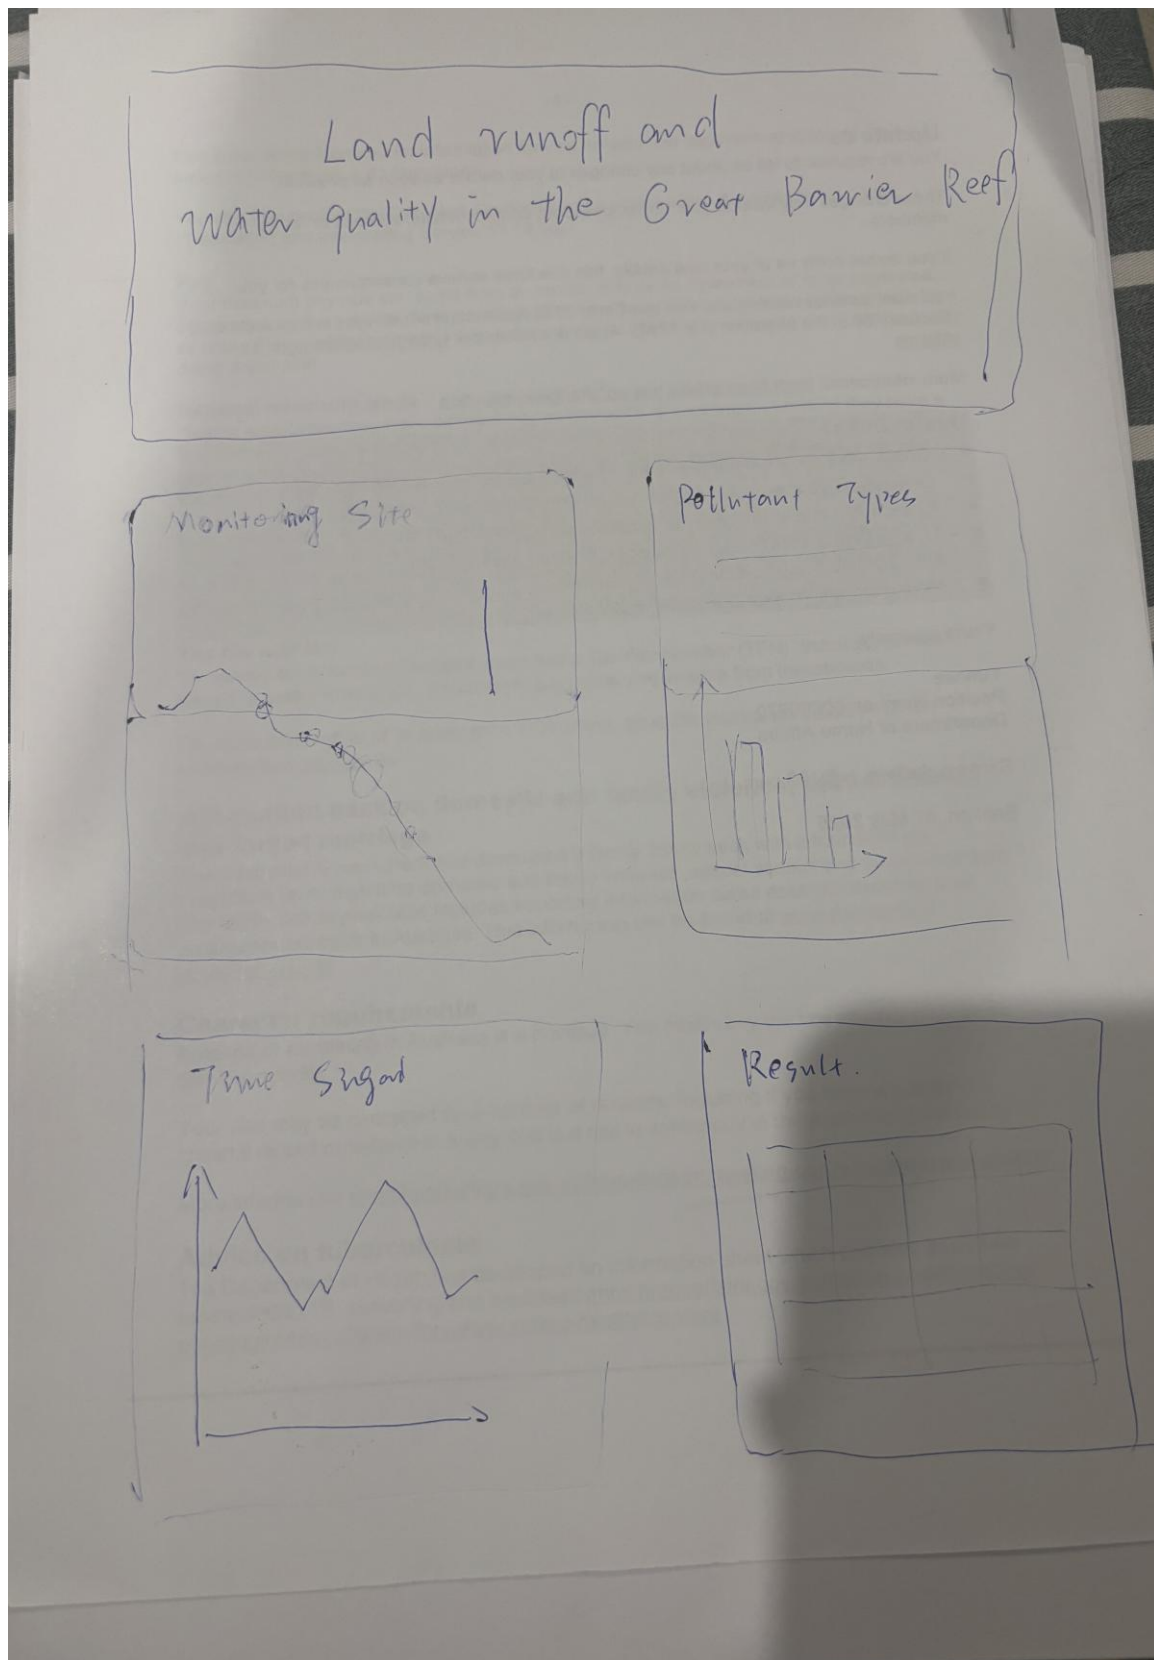

A URL to a PDF document with an image of your sketch on your GitHub account.

Tip: Test your URL in incognito mode to ensure it is a working URL

https://github.com/Viatin11116/New-project/blob/main/submission_assets/great-barrier-reef-sketch.pdf?raw=1

Paste a screenshot of your sketch for your DV II.

Note: Use the entire page here for the screenshot and ensure that it is clearly legible and visible

Part D: Full-size screenshot of your DV II

Paste a full-size screenshot of your DV II assignment from the URL here
